Distributes data to various components

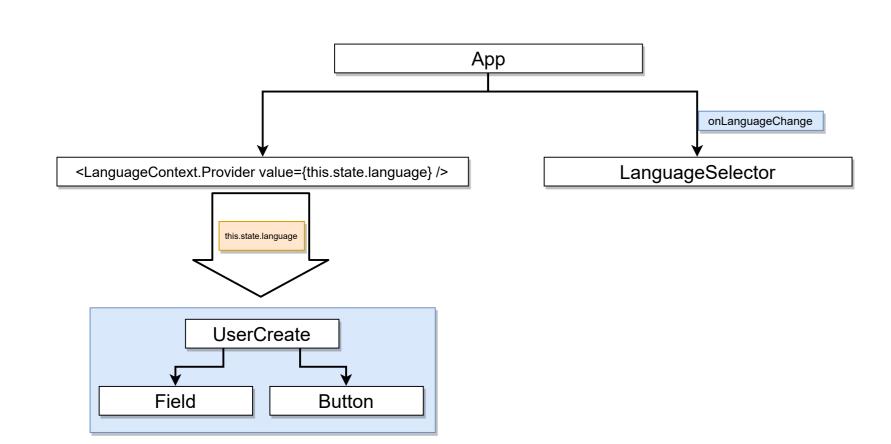

Centralizes data in a store

Provides mechanism for changing data in the store

Distributes data to various components

Context

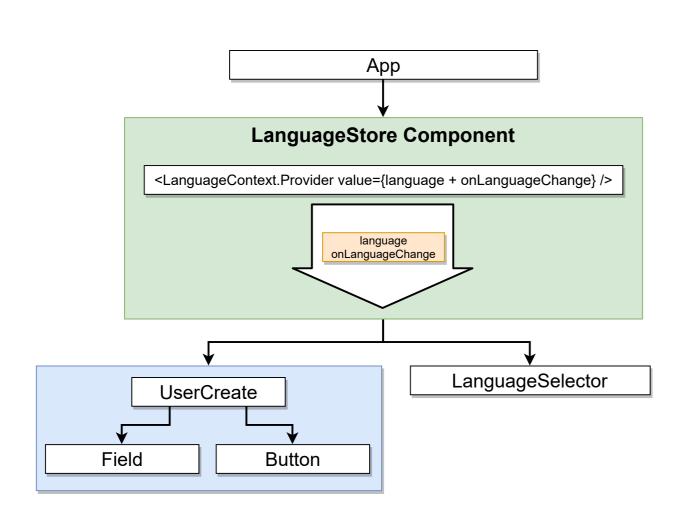

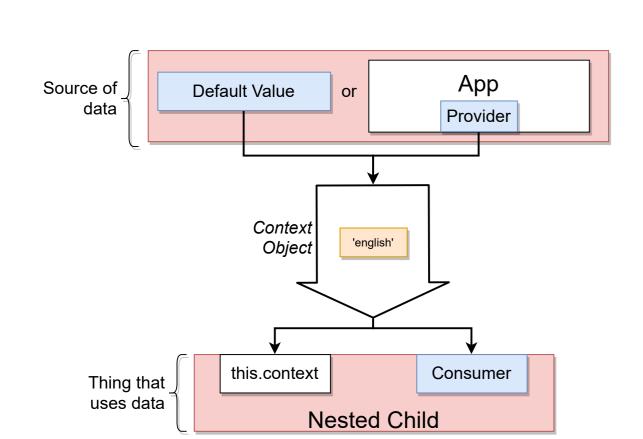

If we want to use Context in place of Redux...

We need to be able to get data to any component in our hierarchy

We need to be able to separate our view logic from business logic

We need to be able to split up business logic (not have a single file with 10000 lines of code)

Redux

Context

Excellent documentation

No need for an extra lib

Hard to build a 'store' component with cross cutting concerns

Tremendous amount of open source libs
